World Fertility

A Chart of Age-Specific Fertility Rates for 120 Countries compiled by the Population Reference Bureau, Inc., in collaboration with the Center for Population Research, Georgetown University, with the financial support of the Demography Division of the Office of Population, U.S. Agency for International Development. This chart is based on an original design by R.T. Ravenholt, John C. Chao, and James W. Brackett published as *World Fertility Patterns* between 1972 and 1977. This version was compiled by Richard M. Kirchberger with the assistance of Leslie A. Curtin and Lisa Christine Olson.

January 1981

Founded in 1929, the Population Reference Bureau has now embarked in its second half century of gathering, interpreting, and disseminating information on the facts and implications of national and world population trends. A private, nonprofit organization, it is supported by grants and contracts, individual and corporate contributions, memberships, and sales of publications. Population Reference Bureau publishes the *Population Bulletin* series of in-depth reports by recognized authorities on trends, problems, and policies in population and related fields; the monthly news magazine *Intercom*, featuring the latest population-related news from around the world; *Intercom* in Spanish, distributed primarily in Latin America; *Interchange*, the population education newsletter accompanied by ready-to-use classroom materials; the *World Population Data Sheet*; and special publications such as the *Population Handbook* in English, French, Spanish, and Arabic language editions, and the *Children's* and *Women's Data Sheets*. Available on order.

This chart shows age-specific fertility rates for 120 countries around the world. Age-specific fertility rates represent the number of children women in a specified age group have in a given year. These rates are derived from data taken from vital registration systems, population censuses, and sample surveys. As with other demographic measures, age-specific fertility rates may suffer from certain biases that can be minimized if adjustments are made. This chart shows those rates which upon examination were deemed reliable. Despite these efforts, however, a few rates are subject to some uncertainty. This is especially true of rates for developing countries in which statistical data sources are less dependable. Whenever possible rates from three points in time have been presented: circa 1965, circa 1970, and most recent date available. Observed differences from date to date may be interpreted as fertility changes. The fertility rates, sources of the estimates, and adjustment procedures used (if any) are given on the reverse side of this chart.

Ce graphique décrit les taux de fécondité par âge pour 120 pays du monde. Le taux de fécondité par âge représente le nombre d'enfants que des femmes d'un groupe d'âge déterminé ont pour une année donnée. Ces taux sont dérivés de données provenant des systèmes d'état civil, des recensements et d'échantillons d'enquêtes. Ainsi que d'autres mesures démographiques, les taux de fécondité par âge peuvent souffrir de certaines inexactitudes qui peuvent être minimisées si l'on procède à des ajustements. Ce graphique décrit les taux qui après examen ont été jugés sûrs. Cependant, malgré ces efforts, quelques taux demeurent sujets à des inexactitudes. Ceci est particulièrement le cas pour les taux des pays en voie de développement pour lesquels les données statistiques de l'état-civil sont de nature moins certaine. Autant que possible, on a présenté des taux de différentes périodes: aux environs de 1965, aux environs de 1970, et les données les plus récemment disponibles. Les différences qu'on observe d'années en années, peuvent être interprétées en termes de changement de la fécondité. Les taux de fécondité, les sources des estimations et les procédures d'ajustement utilisées (le cas échéant) sont indiquées au verso de ce graphique.

Este gráfico presenta las tasas de fecundidad por edades en 120 países de diversas partes del mundo. Las tasas de fecundidad por edades representan el número de hijos que han tenido las mujeres pertenecientes a grupos de edades específicas en un año dado. Dichas tasas se derivan de datos extraídos de los registros estadísticos vitales, censos de población y encuestas por muestreo. Las tasas de fecundidad por edades, como ocurre con otras medidas demográficas, suelen adolecer de ciertos sesgos que con algunos ajustes pueden reducirse. En el gráfico figuran las tasas que una vez examinadas se consideraron fidedignas. No obstante las precauciones tomadas, resta todavía alguna incertidumbre con respecto a un pequeño número de tasas. Estas deficiencias se observan particularmente en las tasas correspondientes a países en desarrollo cuyas fuentes de datos estadísticos son menos dignas de confianza. Siempre que ello es posible, se presentan las tasas de tres períodos distintos: en torno a 1965 y a 1970 y los datos disponibles más recientes. Las diferencias que se observan de una fecha a otra pueden interpretarse como cambios habidos en la fecundidad. En el reverso de esta lámina se da el detalle de las tasas de fecundidad, fuentes de las estimaciones y procedimientos que se hubieran empleado en el ajuste de las tasas.

AGE-SPECIFIC FERTILITY RATES FOR COUNTRIES OF THE WORLD
1965, 1970 and Most Recent Date

(In preparing the chart, an attempt was made to obtain data for 1965, 1970, and for the most recent year during the 1970's for which data were available. Where data for 1970 were not available, those for some other year during the 1960's were used. Where data were available for one but not all periods, only one set of rates is shown.)
